Reading the seed chart:

- 1) Each seed has seven metering rates listed to serve as a starting point for accurate calibration. There are two rows to guide the operator: Pounds per Acre & Pounds per 1000 square feet (illustrated above using Ryegrass/Bluegrass/Fescue as example).
- 2) These rates were measured using the corresponding sprocket combinations. The numbers provide the operator with the number of teeth for the black sprockets.
- 3) The flute exposure illustrates the position of the feed wheels necessary for achieving the desired rate. Large and small seed are adjusted differently, so the operator must pay close attention to the diagrams to determine which direction to shift the flutes in order to increase or decrease the seed rate.
